MATTHEW ST. GERMAIN

Montreal, QC - mattstger@gmail.com · LinkedIn · mattstg.github.io · open to remote roles with US teams

Senior Unity Engineer · Client Lead · AI agent tooling

12 years shipping games and engine tooling in Unity and C#, from mobile live ops to a self-published Steam game. For the last two years I've built AI agent systems that test, fix and ship games: agents that finish a day's work overnight, and testing that cut weekly release checks from 8 -16 developer-hours to about 4.

Experience

Senior Unity Developer Storycraft, Montreal (remote) Aug 2025 - Oct 2026

Owned the game client for Storycraft, a live-ops iOS game built on user-generated worlds, shipping weekly, as the team doubled from ~4 to ~8.

- Built many of the game's player-facing features from design specs: quests, currency and progression, leaderboards, player profiles, interior rooms, object manipulation, an announcement tool and plenty of UI screens.
- Reduced crash rate by 73% (5.5% → 1.5% of sessions). Each world streams hundreds of unique player images that can't be atlased or compressed at build time. Built memory management systems, moved image processing to server, made world loading async and multithreaded, ending most out-of-memory kills and iOS watchdog terminations.
- Built client monitoring and dashboards (Sentry, BigQuery, Amplitude, custom tools) with Discord alerts for crashes and issues.
- Built a multi-agent dev tool that lets one developer run 3 Unity editors at once, each agent on its own task with its own local backend, with CPU and RAM managed across them.
- Extended it into an overnight mode with a CLI test toolchain that drives iOS builds: agents run device test plans that update themselves when commits change the FTUE or core flow, fix what fails across the 3 editors, and queue the fixes for review. About a day's work done overnight, with no production access or merges to shared branches; weekly pre-release testing went from 2–4 developers to one.
- Contributed ~40% of tracked runtime C# code additions across the client team, about twice the next-largest contributor.
- Built the client's analytics: Amplitude tracking for conversion and player behaviour, AppsFlyer attribution the product team used to optimize ad campaigns, and a bug-report tool that relays what the player did (every tap, action and backend transaction) so developers and AI debugging agents could reproduce bugs.
- Owned the weekly release: iOS build pipeline to TestFlight, release note tooling, test plans, bug triage and PR reviews.

Client Lead (Unity/AI engine) Roam, US Company (remote) Feb 2025 - Sep 2025

- Designed and built the core engine of an iPhone game in which AI builds a playable 3D game for the player.
- iOS allows no runtime code generation, so the AI drove a toolset instead of writing code: generating maps, 3D models and animations, assembling behaviour trees, and configuring objectives and scoring through a modular system.
- Cached all generated assets in vector databases so later games reused earlier assets instead of generating them again: about $1 per generated asset, against nothing for a reused one.

Founder / Lead Developer Pansimula, Own studio 2016 - 2024

- Led development of Galactic Thunderdome (Steam, 2024), a 2D physics brawler, and architected its engine: Voronoi destruction with pre-cached, forward-seeking fracture and pooled fragments, and a frame-budgeted job queue split across main and worker threads. 600+ destructible objects at over 60 fps on Steam Deck; maps of 4,000+ objects load in under 4 s.
- Modular weapon system: 80+ weapons assembled from 172 reusable modules; designer tools for 40+ maps; one-click validate, bake and upload to Steam.
- Built contract titles and workflow-automation tools for clients.

Game Developer (Contract) Legends of Learning, US (remote) 2017 - 2022

- Built five educational games and architected the core systems of each; played in classrooms on Chromebook, web and iPad, with 189,000+ teacher and student reviews in total.
- *Educagent (2022):* stealth game where teachers inject their own quiz questions. 530,000+ plays and 100,000+ hours of classroom play.
- *Bid for Life:* five minigames in three weeks, under 15 MB for iPad Air 2.
- *Malfunction*: procedurally generated equations of scaling difficulty, rated 4.37/5 by teachers.

Head of English Game Development Program Institut supérieur d'informatique (ISI), Montreal 2018 - 2023

- Ran the English game-development program: wrote the curriculum for its 7 game courses, taught about 12 different courses (Unity, Unreal, C#, C++, VR, engine tools), and managed 4-5 teachers.
- Onboarded new teachers across the school as it grew fivefold, from ~300 to ~1,500 students.
- Supervised 30+ multi-month student game projects run with Agile Scrum.

Earlier Experience

- Coretech Developer, Playtika (*World Series of Poker*), 2017: cut a 20-minute baking task to 2.5 minutes; automated configuration across production depots.
- Game Developer, Ludia (*Family Feud*), 2016: onboarding tutorial system; core MVC event architecture.
- LCI College, software development teacher (2024 -2025)
- Concordia University, EFREI program teacher (2021)
- CAE, simulation developer (2015)
- VIA Rail, data analyst (2014)

Skills

AI engineering: Claude Code, multi-agent orchestration, MCP servers, agent tooling and editor bridges, Claude Code skills and hooks, agent integrations with Jira, Notion, Amplitude, BigQuery and AppsFlyer, vector databases

Architecture: software architecture, design patterns, core game systems, modular systems built for reuse

Engines: Unity (UI Toolkit / App UI, Job System, compute shaders, ECS, IL2CPP, Addressables, reflection, editor tooling), networking (Unity Relay, RPC, Netcode; Photon), Unreal, custom engines

Systems: multithreading, async/await, thread safety, memory management and profiling, serialization, behaviour trees, GOAP

Languages: C#, C++, Python, TypeScript, Java, Swift, SQL (PostgreSQL)

Testing and delivery: automated and unit testing, CI/CD, Git, Docker, Postman, Web APIs (REST, OAuth), Xcode, TestFlight

Live ops and cloud: Sentry, Google Cloud (BigQuery, Translation API), AWS, Amplitude, AppsFlyer, A/B testing

Platforms: iOS, Android, Steam (Steamworks) and Steam Deck, WebGL / Chromebook, VR

Education

BEng Software Engineering · Concordia University · 2015
